CoGrammar

Welcome to this session:
Database interaction with
MongoDB and Mongoose

The session will start shortly...

Questions? Drop them in the chat. We'll have dedicated moderators answering questions.

Safeguarding & Welfare

We are committed to all our students and staff feeling safe and happy; we want to make sure there is always someone you can turn to if you are worried about anything.

If you are feeling upset or unsafe, are worried about a friend, student or family member. or you feel like something isn't right, speak to our safeguarding team:

Ian Wyles Designated Safeguarding Lead

Simone Botes

Nurhaan Snyman

Scan to report a safeguarding concern

or email the Designated Safeguarding Lead: Ian Wyles safeguarding@hyperiondev.com

Ronald Munodawafa

Rafig Manan

Skills Bootcamp Cloud Web Development

- The use of disrespectful language is prohibited in the questions, this is a supportive, learning environment for all - please engage accordingly. (Fundamental British Values: Mutual Respect and Tolerance)
- No question is daft or silly ask them!
- There are Q&A sessions midway and at the end of the session, should you wish to ask any follow-up questions. Moderators are going to be answering questions as the session progresses as well.
- If you have any questions outside of this lecture, or that are not answered during this lecture, please do submit these for upcoming Academic Sessions. You can submit these questions here: **Questions**

Skills Bootcamp Cloud Web Development

- For all non-academic questions, please submit a query:
 <u>www.hyperiondev.com/support</u>
- Report a safeguarding incident: <u>www.hyperiondev.com/safeguardreporting</u>
- We would love your feedback on lectures: Feedback on Lectures
- If you are hearing impaired, please kindly use your computer's function through Google chrome to enable captions.

Learning Outcomes

- Connect with the MongoDB database using Mongoose
- Creating schemas and models using mongoose
- Designing RESTful APIs and perform CRUD functionalities with Express.js and Mongoose.
- Testing RESTful APIs with Postman.
- Understand the MERN stack architecture.

Database Interaction

Introduction to Mongoose

- Interacting directly with MongoDB in Node.js can be cumbersome and tedious due to its raw API and lack of data validation.
- Mongoose comes into play and provides a higher-level of abstraction for MongoDB by simplifying database interactions and enhancing developer productivity.
- Mongoose is an object data model (ODM), tool that allows the programmer to treat documents stored in databases as JavaScript objects.

Database Interaction

Key Features of Mongoose

- Data validation: This ensures that data adheres to specific criteria before being saved to the database.
- Schema Definition: This allows developers to define schemas that represent the structure of data stores in MongoDB collections.
- Query building: Provides rich API for building MongoDB queries like filtering, sorting, updating and deleting.
- Model creation: Mongoose offer creation of models that serve as constructors for Mongodb documents.

Mongoose

Installation

- Prerequisites:
 - Have a Node.js server with express installed.
 - Have MongoDB server configured locally.
 - > Have a MongoDB atlas account with a cluster running.
- Command for installing mongoose
 - npm install mongoose

Mongoose

Connecting to database

After installing Mongoose, you need to connect to a MongoDB database. We'll import the Mongoose module and utilise it.

```
const mongoose = require("mongoose");
const URL =
   "mongodb+srv://{username}:{password}@cluster0.vrj2mpt.mongodb.net/?retryWrites=true&w=majority&appName=Cluster0";
const clientOptions = {
   serverApi: { version: "1", strict: true, deprecationErrors: true },
};
mongoose
   .connect(URL, clientOptions)
   .then(() => {
   console.log("Connected successfully...");
}
catch((err) => {
   console.log("Error connecting to db", err);
});
```

Mongoose

Connecting to database

- The connect method takes in two arguments, the URI connection string and client options.
- The chaining method using the .then and .catch methods are set for error handling incase the connection is not made successfully.

Creating Schemas

Using mongoose to create schemas

- A schema in MongoDB represents the structure and organization of data within a collection.
- The mongoose.Schema() method takes in an object as an argument that contains the name of data to be stored as the key and its datatype as the value in the object.

Creating Schemas

Using mongoose to create schemas

```
schema.js
    const mongoose = require('mongoose')
    //creates the collection structure of a blog
    const blogSchema = mongoose.Schema({
        //the title of a blog (a string and is required)
        title: {
            required : true,
            type: String,
        //the blog content (a string and is required)
        content: {
            type: String,
            required: true
        //the blog author (a string and is required)
        author: {
            type: String,
            required: true
        //the blog creation time (a date field, auto created itself.)
        createdAt: {
            type: Date,
            required: true,
            default: Date.now
```

Creating a model

Using mongoose to create schemas

- Models in MongoDB represent documents which can be saved and retrieved from the database.
- We create models using the mongoose.model() method, it takes in two arguments:
 - Model name: This is a string that represents the document in our database and how we'll refer to it.
 - The schema object: The structure of the document will be defined by the schema object we just created.

Creating Schemas

Using mongoose to create schemas

```
schema.js
```

29 const BlogModel = mongoose.model('Blog', blogSchema)

Performing CRUD operations with Mongoose.

CREATE

```
schema.js
const BlogModel = mongoose.model('Blog', blogSchema)
const createBlog = async (req, res)=>{
    try {
        const { title, content, author } = req.body
        const blog = await BlogModel.create({
            title: title,
            content: content,
            author: author
        })
        const savedBlog = await blog.save()
        console.log(savedBlog)
        res.send('Blog created successfully')
    } catch(error) {
        console.log(error)
app.post("/create", createBlog);
```

READ

```
schema.js
    //getting all blogs
     const getAllBlogs = async (req, res)=>{
         try {
             const blogs = await BlogModel.find()
             res.json(blogs)
52
54
         } catch(error) {
             console.log(error)
57
    app.get('/blogs', getAllBlogs)
```

UPDATE

```
schema.js
    //update a specific blog
    const updateBlog = async (req, res)=>{
        const { id } = req.params
        const { title, content, author } = req.body
        try {
            const blog = await BlogModel.findByIdAndUpdate(id, {title, content, author}, { new: true})
            res.json(blog)
        } catch (error) {
            console.log(error)
   }
71
    app.put('/update/:id', updateBlog)
```

DELETE

```
schema.js
    //deletes a specific blog
73
    const deleteBlog = async (req, res)=>{
74
         const { id } = req.params
75
        try {
             const blog = await BlogModel.findByIdAndDelete(id)
76
             res.json(blog)
77
78
        } catch (error) {
79
             console.log(error)
81
82
83
84
    app.delete('/delete/:id', deleteBlog)
```

Let's Breathe!

Let's take a small break before moving on to the next topic.

Prerequisites

Setup needed for CRUD functionality

- We've created the following so far:
 - > A Blog Model/document: To store blogs in our database.
 - > A blog schema: The structure of the blog document
- In order to interact with the database via API endpoints, we also need to set up express to have routes.
 - Install Express.js and configure a server
 - Configure routes to access the CRUD endpoints.
- The next slide is a demonstration of the full configuration of Mongoose and Express.

Configuration Setting up Express.js and MongoDB

```
oo index.js
    const mongoose = require("mongoose"); //mongoose import
    const express = require("express"); //express import
    //express configuration
    const app = express();
    app.use(express.json());
    app.listen(8000, () => {
       console.log("Server is running on port http://localhost:8000");
    //mongoose configuration
    const URL =
      "mongodb+srv://{username}:{password}@cluster0.vrj2mpt.mongodb.net/?retryWrites=true&w=majority&appName=Cluster0";
    const clientOptions = {
      serverApi: { version: "1", strict: true, deprecationErrors: true },
    mongoose
      .connect(URL, clientOptions)
      .then(() \Rightarrow {
        console.log("Connected successfully...");
      .catch((err) => {
        console.log("Error connecting to db", err);
```

Questions and Answers

Thank you for attending
